5.80.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the *.h implementation files.

This is the C++ version of the Standard C Library header `math.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file cmath.

Standard Stream Objects

The <iostream> header declares the eight standard stream objects. For other declarations, see `http://gcc.gnu.org/onlinedocs/libstdc++/manual/io.html` *and the I/O forward declarations*

They are required by default to cooperate with the global C library's `FILE` *streams, and to be available during program startup and termination. For more information, see the section of the manual linked to above.*

5.351.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file macros.h.

5.351.2 Macro Definition Documentation

5.351.2.1 #define __glibcxx_check_erase(*_Position*)

Verify that we can erase the element referenced by the iterator _Position. We can erase the element if the _Position iterator is dereferenceable and references this sequence.

Definition at line 216 of file macros.h.

5.351.2.2 #define __glibcxx_check_erase_after(*_Position*)

Verify that we can erase the element after the iterator _Position. We can erase the element if the _Position iterator is before a dereferenceable one and references this sequence.

Definition at line 230 of file macros.h.

5.351.2.3 #define __glibcxx_check_erase_range(*_First, _Last*)

Verify that we can erase the elements in the iterator range [_First, _Last). We can erase the elements if [_First, _Last) is a valid iterator range within this sequence.

Definition at line 244 of file macros.h.

5.351.2.4 #define __glibcxx_check_erase_range_after(*_First, _Last*)

Verify that we can erase the elements in the iterator range (_First, _Last). We can erase the elements if (_First, _Last) is a valid iterator range within this sequence.

Definition at line 256 of file macros.h.

5.351.2.5 #define __glibcxx_check_heap_pred(*_First, _Last, _Pred*)

Verify that the iterator range [_First, _Last) is a heap w.r.t. the predicate _Pred.

Definition at line 441 of file macros.h.

5.351.2.6 #define __glibcxx_check_insert(_Position)

Verify that we can insert into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_iterator.

Definition at line 150 of file macros.h.

5.351.2.7 #define __glibcxx_check_insert_after(_Position)

Verify that we can insert into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a_Safe_sequence and the iterator is a _Safe_-iterator.

Definition at line 167 of file macros.h.

5.351.2.8 #define __glibcxx_check_insert_range(_Position, _First, _Last, _Dist)

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this with the iterator _Position. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.

Definition at line 184 of file macros.h.

5.351.2.9 #define __glibcxx_check_insert_range_after(_Position, _First, _Last, _Dist)

Verify that we can insert the values in the iterator range [_First, _Last) into ∗this after the iterator _Position. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [_First, _Last) is a valid (possibly empty) range which does not reference the sequence we are inserting into. Note that this macro is only valid when the container is a _Safe_sequence and the _Position iterator is a _Safe_iterator.

Definition at line 203 of file macros.h.

5.351.2.10 #define __glibcxx_check_partitioned_lower(_First, _Last, _Value)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value.

Definition at line 385 of file macros.h.

5.351.2.11 #define __glibcxx_check_partitioned_lower_pred(_First, _Last, _Value, _Pred)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

Definition at line 407 of file macros.h.

5.351.2.12 #define __glibcxx_check_partitioned_upper_pred(_First, _Last, _Value, _Pred)

Verify that the iterator range [_First, _Last) is partitioned w.r.t. the value _Value and predicate _Pred.

Definition at line 420 of file macros.h.

5.351.2.13 #define __glibcxx_check_sorted_pred(_First, _Last, _Pred)

Verify that the iterator range [_First, _Last) is sorted by the predicate _Pred.

Definition at line 350 of file macros.h.

5.351.2.14 #define _GLIBCXX_DEBUG_VERIFY_COND_AT(_Cond, _ErrMsg, _File, _Line, _Func)

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 50 of file macros.h.

5.379.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see https://gcc.gnu.org/onlinedocs/libstdc++/manual/dynamic_memory.html for more.

Definition in file new.

5.379.2 Function Documentation

5.379.2.1 void operator delete (void *) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw bad_alloc on error)
- normal array new and delete (same)
- nothrow single new and delete (take a nothrow argument, return NULL on error)
- nothrow array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.379.2.2 void operator delete (void *, const std::nothrow_t &) [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw bad_alloc on error)
- normal array new and delete (same)
- nothrow single new and delete (take a nothrow argument, return NULL on error)
- nothrow array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.379.2.3 void operator delete (void *, void *) [inline], [noexcept]

These are replaceable signatures:

- normal single new and delete (no arguments, throw bad_alloc on error)
- normal array new and delete (same)
- nothrow single new and delete (take a nothrow argument, return NULL on error)
- nothrow array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

5.393.1 Detailed Description

Parallel STL function calls corresponding to stl_numeric.h. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

5.524.1 Detailed Description

Parallel implementations of set operations for random-access iterators. This file is a GNU parallel extension to the Standard C++ Library.

5.525 settings.h File Reference

Classes

- struct __gnu_parallel::_Settings

Namespaces

- __gnu_parallel

Macros

- #define _GLIBCXX_PARALLEL_CONDITION(__c)

5.525.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

5.525.2 Deciding whether to run an algorithm in parallel.

There are several ways the user can switch on and off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag gnu_parallel::sequential_tag() to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable __gnu_parallel::_Settings::algorithm_strategy is checked. It is a tristate variable corresponding to:

- a. force_sequential, meaning the sequential algorithm is executed.
- b. force_parallel, meaning the parallel algorithm is executed.
- c. heuristic

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(__s). The threshold can be set by the user, individually for each algorithm. The according variables are called gnu_parallel::_Settings::[algorithm]_minimal_n .

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

Definition in file settings.h.

5.525.3 Macro Definition Documentation

5.525.3.1 #define _GLIBCXX_PARALLEL_CONDITION(__c)

Determine at compile(?)-time if the parallel variant of an algorithm should be called.

Parameters

__c	A condition that is convertible to bool that is overruled by __gnu_parallel::_Settings::algorithm_strategy. Usually a decision based on the input size.

5.567.2 Macro Definition Documentation

5.567.2.1 #define _GLIBCXX_DEQUE_BUF_SIZE

This function controls the size of memory nodes.

Parameters

__size	The size of an element.

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch _GLIBCXX_DEQUE_BUF_SIZE only if you know what you are doing, however: changing it breaks the binary compatibility!!

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except std_utility.h. For more information, see the thread of about twenty messages starting with http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html, or http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads

Short summary: the rel_ops operators should be avoided for the present.

5.611.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (throw_value, throw_allocator) intended to be used as value and allocator types while testing exception safety in templatized containers and algorithms. The allocator has additional log and debug features. The exception generated is of type forced_exception_error.

Definition in file throw_allocator.h.
